                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a method of treating fibrosis in a mammal by administering an interleukin-13 (IL-13) antagonist or an IL-4 antagonist. In particular, the IL-13 antagonist is the IL-13 binding chain (IL-13bc; AAB29747, AAB29748) of the IL-13 receptor (IL-13R), or soluble fragments thereof. The method is useful for treating or inhibiting the formation of tissue fibrosis resulting from the healing of a wound, including a surgical incision wound, or from infection with schiscosoma. The method may be used to treat fibrosis in a variety of tissues, particularly liver tissue, but also skin epidermis, skin

The invention relates to the use of a nucleic acid or vector CC encoding a polypeptide with at least 70% identity to interleukin-13 CC receptor alpha-2 chain (IL-13R alpha-2; AAM49201) for rendering a CC cancer cell sensitive to IL-3R-targeted immunoconjugates or for CC inhibiting the growth of a cancer cell. In some cancers that exhibit CC little or no expression of IL-13R transfection with the IL-13R CC alpha-2 chain is sufficient to inhibit growth, while in CC other such cancers, the introduction of the IL-13R alpha-2 chain enables immunoconjugates (such as immunotoxins) that comprise IL-13 to be CC in the inhibition or death of cells in the invention also results (CC in the inhibition or death of cells in the tumour which were not CC in the inhibition of at least some of the cells of a tumour with the IL-13R alpha-2 chain causes the secretion of a cytokine or other factor that CC alpha-2 chain causes the secretion of a cytokine or other factor that CC alpha-2 chain activated to kill the tumour cells. Because a nucleic acid encoding just the IL-13R alpha-2 chain is used, rather than a much larger CC uncleic acid encoding the multiple chains of the entire IL-13R, the CC choice of vectors that can be used for transfection. A wide range of CC cancers can be treated using the methods of the invention, including CC brain cancer, head and neck cancer (preferably sequamous cell carcinoma), breast cancer, postate cancer, lung cancer, mesothelioma, pancreatic cancer, colon cancer, gastric cancer, ovarian cancer, renal cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Use of nucleic acid or vector encoding interleukin-13 receptor alpha chain polypeptide that binds IL-13, for sensitizing a cancer cell e.g brain cancer cell to effector molecule or inhibiting growth of cancer
                                                                                                                        bladder cancer, prostate cancer, testicular cancer, skin cancer, cancer, uterine cancer, or sarcoma. The present sequence represent the human IL-13R alpha-2 chain which is specifically claimed for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ş
shares homology with cytokine receptors and was isolated from a human testis cDNA library. The resulting polypeptide is a receptor for cytokines (particularly interleukin-13) and is expressed on the surface of testicular cells, probably being involved in spermatogenesis. It can be used to detect ligands that promote proliferation and/or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               differentiation of such cells in cultures and may also be used to treat infertility. Antagonists of this receptor may be used to characterise ligand-receptor interactions and as male-specific contraceptives. By blocking the action of IL-13, receptor antagonists and ligand-binding this receptor can also be used to modulate immune function, e.g. in allergy and astima, as a diagnostic to determine circulating levels of ligand and also to isolate and purify ligands. Antibodies can be used to assay circulating receptor (an abnormal level may be indicative of disease such as cancer), for labelling cells that express the receptor,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         and/or differentiation of such cells in cultures and may also be used to treat infertility. Antagonists of this receptor may be used to characterise ligand-receptor interactions and as male-specific contraceptives. By blocking the action of II-13, receptor antagonists and ligand-binding this receptor can also be used to modulate immune function, e.g. in allergy and asthma, as a diagnostic to determine circulating levels of ligand and also to isolate and purify ligands. Antibodies can be used to assay circulating receptor (an abnormal level may be indicative of disease such as cancer), for labelling cells that express the receptor, and therapeutically as antagonist.

                                                                                                                                           밁
                                                                                                                                                                                                              Db
                                                                                                                                                                                                                                            Ş
                                                                                                                                                                                                                                                                                                                                                                            CC The invention relates to an isolated soluble zalphall cytokine receptor CC polypeptide and their cDNA molecules. Zalpha proteins are useful for CC inhibiting or antagonising the ligand activity-induced proliferation of CC haematopoietic cells and haematopoietic cell progenitors preferably CC Zalpha is useful for treating immune and inflammatory disorders, for CC Zalpha is useful for treating immune and inflammatory disorders, for CC Zalpha is useful for treating immune and inflammatory disorders. Zalpha is CC immune response in a mammal exposed to an antigen or pathogen. Zalpha is CC useful for treating diseases that require immune regulation including CC autoinmune diseases such as rheumatoid arthritis, multiple sclerosis, CC myasthenia gravis, systemic lupus erythematosus (SLE) and diabetes; CC asptina, ulcerative colitis, inflammatory bowel disease, Crohn's disease, CS espais, viral infection (dengue virus infection) and cancer. The present CC sepais, viral infection (dengue virus infection) and cancer. The present CC sepais, viral infection (dengue virus infection) and cancer. The present CC sepais in the color of the invention.

                                                                                                                                                                                                                          The II-13 binding protein and related therapeutic molecules can be used in the antagonism of at least one II-13 activity. They can be used for treating II-13 mediated conditions such as certain allergic conditions such as asthma or to inactivate locally administered II-13 after II-13 treatment. The products can also be used as diagnostic agents, e.g. for detecting autoimmune diseases. The antibodies can also be used for immunotherapy and may also be used as a diagnostic tool.
